Please save this manual for future reference.

CAUTION: Read and follow all Safety Rules and Operating Instructions before using this product.

LHR Technologies Inc., Pasadena, Texas 77504
Introduction

The CarveWright™ Scanning Probe Accessory will open up a whole new world of possibilities for CarveWright System users. The scanning probe will enable height mapping of existing surfaces and objects that can then be imported into the CarveWright Design Software libraries for use on any project. This manual will explain the many features of the CarveWright Scanning Probe to help make the scanning functionality easy to understand and rewarding to use. The Scanning Probe can be used with either the Quick Change Chuck or CarveTight Spindle system.

Important Note: It is recommended that you unplug your flexshaft from the spindle if you are doing significant scanning. It makes for more consistent scans. Be sure to always follow the directions when re-assembling the flexshaft so that you do not bind the flexshaft core and damage the machine.

For access to online information about the CarveWright Design Software visit http://www.carvewright.com.

WARNING or CAUTION:
Look for this symbol to point out important safety precautions. It means attention -- Personal safety is involved!

Look for this symbol to point out helpful information and hints that will allow maximum efficiency and enjoyment of the CarveWright Scanning Probe.

CARVEWRIGHT SIX MONTH LIMITED WARRANTY

If this product fails due to a defect in material or workmanship within six months from the date of purchase, return it to CarveWright for free replacement.

This warranty gives you specific legal rights, and you may also have other rights, which vary from state to state.

Unpacking the Scanning Probe

The scanning probe will come packaged with the following:
  A) 3-D Scanning Probe mounted in a tapered Quick Change adapter or Straight Bushing for the CarveTight
  B) Scanning Probe Jumper Cable
  C) CarveWright Scanning Software CD
  D) Operators Manual

Safety Precautions

General Safety Rules For Using the CarveWright

**ALWAYS BE ALERT.** Operating electrically powered machinery poses a risk of serious physical injury to hands and fingers. Always operate machinery with **ALL** guards in place and in good working order. **DO NOT** attempt to defeat safety guards!

- **KNOW THE POWER TOOL.** Read the CarveWright operator's manual carefully. Learn the machine's applications and limitations as well as any specific potential hazards related to this tool.
- **DISCONNECT** the CarveWright from the outlet when not in use or before servicing.
- **GUARD AGAINST ELECTRICAL SHOCK** by preventing body contact with grounded surfaces such as pipes, radiators, or appliances while operating.
- **DO NOT OPERATE ANY POWER TOOL WHILE UNDER THE INFLUENCE OF DRUGS, ALCOHOL, OR ANY MEDICATION AFFECTING ALERTNESS.**
- **STAY ALERT AND EXERCISE CONTROL.** Stay alert and use common sense. Do not operate the tool when tired. Do not rush.
- **BE SURE THE SCANNING PROBE CLEARS THE WORKPIECE.** Never start the system with the probe tip touching the work piece.
- **NEVER ATTEMPT TO DEFEAT SAFETY DEVICES OR INTERLOCKS.** Guards and other safety devices protect the user from injury; do not try to bypass or remove them.
- **DO NOT PLACE HANDS ON THE GRIT SURFACE DRIVE BELTS DURING OPERATION.** Belts in motion could drag a hand into the machine and cause injury.
- **USE A SUPPORT FOR LONG WORKPIECES.** To minimize the risk of over stressing the machine, use a sturdy "outrigger" support when scanning long workpieces more than 36 inches in length. Never substitute a person for a proper support.
Machine and Probe Configuration

The key components of the CarveWright System and Scanning Probe are shown in the following illustration.

It is helpful to review and understand the directional conventions for the CarveWright machine when working with the scanning probe. Please refer to Figure 2. This manual will refer to these conventions throughout.
**FIGURE 2: CARVEWRIGHT DIRECTIONAL CONVENTIONS**

- **1/2" Gap**
Scanning Probe Installation

The Scanning Probe can be used with either the Quick Change Chuck (QC) or CarveTight Spindle system. For the CarveTight, simply insert the straight bushing all the way into the machine spindle and tighten the grab paw just like you would when using a 1/2" shank bit. If you have upgraded to the CarveTight spindle, remove the tapered adapter and press the straight bushing down to within 0.25" of the probe body (See Figure 3).

If you have a QC the Scanning probe will install just like any other bit with a tapered adapter. Please follow the directions described below. Before installing the scanning probe into the QC, lift up the front safety cover and make sure that there are no other bits installed. Next, make sure that the quick release chuck is cocked and ready to accept the adapter mounted to the probe.

To cock the chuck, place a thumb on the Z-Truck Grip Ridge and two fingers on the Chuck Release Flange. Press up on the chuck release flange as far as possible and release (See Figure 4). The flange will snap and stay up when the chuck is prepared to receive the probe assembly. Any time difficulty is encountered inserting the probe, simply pull up on the flange to insure the chuck is cocked. Press the probe assembly into the chuck until a slight snap is felt. The probe is now secure in the quick change.

There are two possible connector locations for plugging in your scanning probe depending on the configuration of your machine. For most machines that have an A-series Serial Number, the probe plugs directly into the Z-Truck mono receptacle.

![Figure 4: Quick Release Chuck Features](image)

![Figure 5: Plugging In the Probe in Most A-Series Machines](image)

All motors are disabled whenever the cover is open. The cover must be closed before the machine can proceed.
All C or B-series Serial Number CarveWright machines, and any A-series Serial Number machines that have been reconfigured, will plug into an accessory connector found on the left side of the head cover as shown below. Reconfigured A-series machines have the homing sensor board removed or unplugged. This configuration requires that a jumper cable be used to span the distance from the probe cable to the cover connector. A cable clip is loosely attached to the cable to manage the cable during the scanning operation. This cable and clip are now provided with the probe at the time of purchase but you may need this cable if: 1) you have an A serial machine, 2) you purchased your probe before November 1, 2008, and 3) the machine has been reconfigured by removing or unplugging homing sensor board.

To install the probe using the cover connection, simply plug the jumper cable into the cover connector and slide the cable clip over the front lip of the head casting. The clip needs to be approximately centered left to right in the machine. Next, plug the probe mono jack connector into the other end of the jumper cable. Make sure that the cable clip allows enough slack for the probe to move fully left to right by pushing the truck to the left/right sides of the machine with your hand. The probe is now installed.

**FIGURE 6: PLUGGING IN THE PROBE IN MOST B-SERIES MACHINES**
Since there are two possible locations to connect the probe, the connection location must be set in the machine’s memory via the Options menu through the machine keypad. The B-serial number CarveWright machines are configured to the correct setting at the factory, but this setting must be changed if the homing sensor board is eliminated or unplugged from the reconfigured A-series machines. If this setting is not changed, “Scan Area” will be displayed on the LCD screen even though there is no probe connected. To change this setting, do the following:

1) Insert the card and turn on the machine. “Scan Area: should appear on the LCD screen.
2) Press the “0” (Options) key on the keypad.
3) Using the up/down arrows, scroll down to the number 5, “User Options” menu item and press ENTER. You can also simply press the “5” key when the first option appears.
4) Scroll down to Scan Probe. Make sure it is on “Cover” instead of “Z truck”. Press ENTER to toggle between the options.
5) Press stop until you get back to main menu. It should say Project Menu.

Insert the probe plug into the jack located on the Z-Truck. If the probe is correctly installed the CarveWright machine will recognize it when the cover is closed and power is turned on. The scanning functionality can now be accessed through the keypad.

Once the machine is configured and turned ON, it will search to see if the scanning probe jumper cable is plugged into the accessory connector. If it is, the machine assumes that the user has inserted, or will insert, the scanning probe into the quick release chuck and disables the spindle motor from spinning. Pressing ENTER at the “Scan Menu” will move the spindle to the home position. Once at the home position, the machine will check to see that the probe is plugged in and operating correctly.

When the probe is at rest (not touching anything), it should be in the electrically Closed position. If the probe is operating correctly, the LCD will prompt you to “Jog to the Starting Corner”. If however, the machine detects that the probe is not in the Closed position, the LCD will prompt you to “Check Probe and Connection” and will show you the current state of the probe as Open. In most cases this simply means that the probe is not plugged into the jumper cable correctly. Check all connections and move the tip of the probe around watching to see if the state displayed on the LCD changes to Closed. If you cannot resolve this issue by plugging and unplugging, please call CarveWright service at 713-473-6572.

When removing the jumper cable remember to depress the release latch before pulling it free. On some machines the latch may be on the bottom of the connector.

Important Note: It is recommended that you unplug your flexshaft from the spindle if you are doing significant scanning. It makes for more consistent scans. Be sure to always follow the directions when re-assembling the flexshaft so that you do not bind the flexshaft core and damage the machine.
Placing Object on a Scanning Sled

Because most objects that will be scanned are not suitable for scanning directly they will have to be placed onto a fixture called a scanning sled before proceeding (not included with purchase). The scanning sled should be designed so that the CarveWright can easily feed it through the machine and so that the scanning probe has the proper clearances to function.

Please visit the CarveWright website (www.carvewright.com) to download a set of plans to make your own.

The dimensions of the sled can vary but the maximum width is 14.5" and the maximum depth is 2.25" from the mounting surface to the top of the rails. There is no maximum length but any sled over 3 feet long will require additional stand-alone outfeed support rollers. The support rollers should be adjusted properly to avoid letting the sled sag or rise, as any transition going on and off the rollers will be reflected in the scan data.
The vertical rails must be at least as high as the object being scanned. If the object is taller than the vertical rails the machine or object can be damaged.

The maximum height that the scanner body can clear is 1 inch. If the object to be scanned is taller than 1 inch in any location, check for possible interferences between it and the probe body. Interference is possible if there is a 1 inch tall point in the object within 1 inch of a portion of the object that lies at a depth near the mounting surface.

The scan object can be mounted to the sled with any number of adhesives. Hot glue works well as does double sided tape. It is important that the scan object be rigidly mounted. Any movement during scanning will produce poor scan data. It is also suggested that the mounting surface of the sled be very smooth and hard (like Formica). This hard surface makes mounting and removing the scan objects quick and easy.

The CarveWright will require that the sled be kept under rollers at all times so make sure that the object being scanned is at least 3.5 inches from either end of the sled. The scan object must also be at least 1 inch from either vertical rail to clear the body of the probe.

Adding a grid pattern to the mounting surface of the sled surface makes positioning the scan object very easy.

**Inserting the Scanning Sled**

For the purposes of this manual we will assume that all pieces being scanned will be mounted to a scanning sled. Proper installation of the scanning sled is critical to the performance and continued operation of the scanning probe. To properly insert the sled:

1. Press down on the sliding guide plate release lever and move the sliding guide plate to the right so that it will clear the width of the sled.

2. Check the bottom of the sled for features that will make it unusable in the machine. The bottom surface of the sled where it contacts the squaring plate must be flat and level for a width of at least 3/8 inches along the bottom edge to allow the Board Tracking Sensor to accurately calculate the position of the workpiece at all times (see Figure 7).

3. Lay the sled on the traction drive so that it is centered lengthwise under the head.

4. Push the sled firmly up against the squaring plate.
5. Gently push the sliding plate up against the inside edge of the sled. **DO NOT** push the sliding plate against the sled with significant force. The sliding plate is used to guide the sled and is not intended to lock the piece in position.

6. At this point it is critical that you assure that the sled can travel freely in and out of the machine along its entire length without binding or encountering significant drag. Do this by moving the sled in and out of the machine by hand, while laying flat on the traction drive.

**WARNING:** Do not attempt to load a sled that varies in height by more than 1/16” along its entire length. This condition could bind the machine and damage the traction drive.

**WARNING:** Do not attempt to load a sled that does not have parallel sides. This condition can bind the machine and damage the traction drive.

7. Lower the head by turning the head crank handle counter-clockwise until the clutch clicks several times (at least 5 clicks recommended). The clutch is intended to load the sled against the traction drive with consistent force.
8. Rotate the head-locking lever outward into the locked position. The sled is now secure.

9. Make sure that the top safety cover is closed before proceeding.

![Locking Lever in Locked Position]

**FIGURE 10: LOCKING LEVER CONFIGURATION**

---

**Jogging the Scanning Probe**

Before the CarveWright can begin to function, the CarveWright memory card must be installed. With the power off, push the memory card gently into the memory card slot until it stops, making sure the label is up. Once the sled is installed and the cover is closed, proceed to turn the machine on.

At this point, control is accessed through the Keypad and LCD Display. The scan utility will automatically sense the scanning probe and will display the *Scan Area* menu item.

![CarveWright Input Keypad]

**FIGURE 11: CARVEWRIGHT INPUT KEYPAD**
Setting the Scan Area
When the Scan Area item has been selected from the display menu, the CarveWright will send the head to the home position. The display will then prompt for the user to specify the starting corner of the scan area.

The scan area is determined by specifying any two diagonal corners of the scan object. The user will need to jog the probe tip to the first corner point using the arrow keys. This is accomplished using the up and down arrows on the keypad to move the truck across the width of the sled (near to far), and the left and right arrows to move the sled along its length (left or right).

Holding an arrow key down results in a fast movement. Precise final positioning is accomplished using short bumps on the key.

Once the probe tip has been jogged to the desired corner location press ENTER. The probe tip will now slowly lower until the tip touches the surface. Verify that this is the correct location and press ENTER again. You can continue to tweak the tip location if it is desired before pressing ENTER. Repeat these steps for specifying the second corner.

Setting the Scan Options
Once both corners have been specified the display will show the Scan Options menu. The current scan quality will be shown in parentheses. The Scan Options menu has three options: 1) Proceed with Scan, 2) Change Quality, and 3) Set Max Depth.

If you wish to continue with the scan at this point select option one, Proceed with Scan. If you wish to change the quality setting select option two, Change Quality. Use the up/down arrow keys to find the desired quality and select ENTER to confirm. These quality modes affect the step size for each point measurement taken. The higher the quality mode selected, the smaller the step size. The Best setting step size is .010", the Normal setting step size is .020" and the Draft setting step size is .040". It is recommended that scans be performed at the highest possible quality setting if time permits.

The machine will check the memory card to verify that there is enough space to store all of the scan information. An empty memory card can hold approximately 2.2 ft² of Best quality mode scan data. If the message Scan Too Large For Card appears on the display then there is not enough room to store the proposed scan. Options to correct this situation are to reduce the size of the scan area or delete existing information on the card using the Flash Manager in the CarveWright Design Software.

After the quality mode has been confirmed the CarveWright display will show the Scan Option menu again. There are instances where the maximum depth of the scan will need to be limited. For example, in some
areas the object being scanned may be deeper than the length of the scanning probe, which can cause the body of the scanner to impact the object and stall the scan. The Set Max Depth option allows the user to put a floor on the depth that the probe tip will reach. The procedure for setting the max depth works very similar to setting the corners of the scan area. Identify the desired max depth on the scan object surface. Jog the probe tip to a point directly over this location and press ENTER. At the chosen location the probe will lower until it makes contact with the surface. By default this depth will now be the maximum scan depth. If this depth is acceptable select ENTER otherwise reposition the probe tip and repeat. Once a max depth has been confirmed the display will prompt the user to Use Selected Depth or Apply Offset. If the Apply Offset option item is chosen, the user is prompted to input a numeric offset using the keypad. Select ENTER to proceed or STOP to cancel the offset. The entered offset will be added to the already confirmed max depth.

Once the desired settings have been set, proceed with the scan by selecting Proceed with Scan. The CarveWright will begin to scan the object. The scanning probe tip will follow along the object contour, mapping the 3-D coordinates of the surface as it proceeds. The height map information is stored onto the memory card for future retrieval by the scanning software. A real time scanning completion estimator will be displayed on the LCD and provides an estimate of how much of the current scan is completed.

At any point during operation the CarveWright machine can be stopped by pressing the STOP key or by lifting the cover. If desired the machine can be restarted by closing the cover and pressing ENTER. The machine will resume scanning at the point where it was stopped. If you press the stop button a second time the scan will be aborted so be careful when restarting your project.

WARNING: Never remove the memory card from the machine while it is on. Doing so can result in damage to the workpiece.

**Accessing the Scan Data**

When the scan is completed the LCD Display will show a prompt to set another scan area. If you do not wish to produce another scan, turn off the machine, lift the top safety cover, release the head lockdown lever, and crank the head up to free the sled. The sled can then be removed. Remove the CarveWright memory card and place it into the CarveWright memory card programmer. Open the CarveWright Design software and access the scan data by selecting the Download Scan menu item on the File menu.
General Tips and Helpful Reminders

MAXIMUM SCANNING DEPTH is 1.0 inch. Scanning objects deeper than this can damage the probe or produce poor quality scans.

ALL MOTORS ARE DISABLED when the front safety cover is open. The cover must be closed before the machine can proceed.

USE A SUPPORT FOR LONG PIECES TO BE SCANNED AND ALSO FOR SCANNING SLEDS. To minimize the risk of over stressing the machine, use sturdy roller stands (not included) for support when scanning long pieces more than 36 inches in length.

WHEN LOADING THE PIECE TO BE SCANNED, there are several critical checks to make before proceeding.
- Do not attempt to load a piece to be scanned (or sled) that has a significant taper to the sides. A tapered workpiece will bind between the sliding plate and the squaring plate and will damage the traction drive.
- Do not attempt to load a piece to be scanned (or sled) that varies in thickness by more than 1/16” along its entire length. Using a workpiece with a larger thickness variation than 1’16” can lead to damage to the machine.
- Always make sure the Board Tracking Sensor that contacts the bottom of the workpiece (or sled) has a smooth, even surface to follow. This means that the bottom edge area of the workpiece adjacent to the squaring plate is clean, smooth, and even for a width of at least 3/8 inch along the full length of the workpiece.
- Warped, bowed, or cupped pieces should be used only if this condition is minor and if the Board Tracking Sensor can follow it.

MAKE SURE THAT THE HEAD LOCKING LEVER IS RELEASED after finishing the scan. If the locking lever is not released the head will not move up and down. The lever is in the locked position if it is rotated out from the face of the machine. It is in the released position if it is flush to the front face of the head.

SMALL PIECES TO BE SCANNED MUST ALWAYS USE A SCANNING SLED. Any piece to be scanned smaller than 1.5 inches wide x 0.25 inches thick x 7 inches long will require it to be placed on a scanning sled.

TO LOCATE THE MACHINE TOTAL SCAN-TIME, use the Options shortcut key on the keypad to access the information.

TO LOCATE THE SERIAL NUMBER, use the Options shortcut key on the keypad to access the information.

UNPLUG THE FLEXSHAFT, for consistent results.
